*Himaylan ranked as 5

CKISS Priority List Definitions

1a. Provincial EDRR	Those species which are considered provincial EDRR species by the Provincial government as designated by "Prohibited" under the updated Weed Control Act regulations. CKISS reports occurrences to MFNLROD; MFNLROD will initiate treatment. For a list of current species, see: https://www.for.gov.bc.ca/hra/invasive-species/Proposed_Prohibited_Noxious_Weeds_Apr2016.pdf
1b. Regional EDRR	These species may not occur in the region or have less than 10 known sites across the region in IAPP. The goal for these species is immediate eradication if they are detected. EDRR reporting and action protocols for these species are outlined in Section 3.4. These sites are extremely high priority for treatment.
2. Eradication/Annual Control	These species are known in the IPMA but with very limited distribution. Some of these species may have been present for a relatively long period so monitoring for spread is the management objective. Other species are relatively new to the IPMA so eradication is the objective.
3a. Containment	These species are abundant (with no expectation of eradication) in certain portions of IPMA but have limited distribution in other portions. Management efforts are delineated by containment lines which may be based on geographic (i.e. a specific region) or jurisdictional boundaries (e.g. private gardens only). Some of these species have biocontrol (BC) agents available which may be useful within the containment line.
3b. Contain to Gardens	These species occur throughout the Kootenays, primarily in gardens. The goal is to contain them to gardens so they don't spread into natural areas, transportation corridors, or other "natural" lands.
4a. Established: no Biocontrol or Site Specific Approach	These are widespread species that are beyond landscape-level control and/or have relatively low impact. Land managers may choose to treat these species at high priority sites (e.g. wildlife habitat, corridors of spread, adjacent to agricultural land, restoration sites, etc.) based on specific land management objectives. These species have no biocontrol agents available.
4b. Established: Biocontrol or Site Specific Approach	These are widespread species that are beyond landscape-level control and/or have relatively low impact. Land managers may choose to treat these species at high priority sites (e.g. wildlife habitat, corridors of spread, adjacent to agricultural land, restoration sites, etc.) based on specific land management objectives. These species have biological control agents available.
5. Watchlist	These species have insufficient information available in regards to their distribution, impacts, potential for spread and/or feasibility of control. Targeted inventories are recommended and potentially risk assessments.
